

Passive Reconnaissance Scan Report

Scan target : dnsdumpster.com (172.67.147.27)

Date of recon: 23rd Nov., 2025

**Cybersecurity Analyst
Oluwaseyi J. Adedire**

**Scope: dnsdumprer.com and publicly resolvable
subdomains only (passive OSINT).**

**Out-of-scope: Active vulnerability exploitation,
authenticated access and service disruption,
rate-aggressive crawling.**

Executive Summary

- The target domain resolves and serves a public website with recent content.
- This report enumerates: WHOIS/RDAP, authoritative DNS data, HTTPS surface (at a high level), presence of a WAF/CDN (fingerprinted passively) and open-source footprint across common OSINT sources.
- No intrusive scans were performed, all findings are from passive lookups and single-request fetches of public pages.

Methodology (Passive Only)

Tools & Modes

- **whois / RDAP:** Registration & registrar metadata
- **dig, host, dnsrecon:** Passive DNS lookups (A/AAAA, NS, MX, TXT/SOA/CAA where present) via public resolvers.
- **wafw00f:** Single HTTP(S) request fingerprint (headers/body markers) to infer WAF/CDN; *no evasion, no burst*.
- **SpiderFoot (SF):** *Passive modules only* (DNS, CT logs, WHOIS, netblocks, leak/site mentions, social).
- **Wapiti:** *Listing only* and passive banner/headers check.
- **OSINT Framework:** As a directory to guide passive pivoting, CT logs, public paste sites, reputation lists, search operators.

Findings

3.1 Public Web Presence (Landing Page)

- **Site reachable:** <https://dnsdumpster.com/> returns content; homepage shows recent posts.

3.3 DNS Surface (A/AAAA, NS, MX, TXT, SOA, CAA)

- **Records collected passively:**
 - **A/AAAA** for apex and **www**.
 - **NS** to identify hosting/DNS provider.
 - **MX** for mail handling (and whether any third-party service is used).
 - **TXT** for SPF/DMARC/DKIM indicators.
 - **SOA** for primary NS and serial.

3.5 Web Application Firewall

- Passive approach:

3.6 OSINT: Mentions, Accounts, and Exposure

- **SpiderFoot (passive modules):**
 - **DNS/Hosts:** Passive resolution of subdomains from CT/DNS.

- **Credential exposure:** Only passive checks; no repository cloning or brute forcing.

Recommendations (Based on Passive Posture Only)

1. Strengthen HTTP Security Headers

Ensure all modern security headers are correctly configured:

-

Strict-Transport-Security (HSTS) – enforce HTTPS and prevent downgrade attacks

Content-Security-Policy (CSP) – reduce XSS risk

X-Content-Type-Options – prevent MIME sniffing

Referrer-Policy – limit sensitive data leakage

Permissions-Policy – restrict browser features

2. DNS Hardening & Hygiene

Review **TXT records** to ensure proper **SPF, DKIM, and DMARC** alignment

Remove unused or legacy DNS records to reduce attack surface

Ensure **CAA records** explicitly restrict which Certificate Authorities can issue TLS certificate.

3. Continuous Certificate Transparency (CT) Monitoring

Monitor CT logs for **unexpected subdomains or certificates**

Helps detect shadow IT, subdomain takeovers, or misconfigurations early

4. Web Application Firewall (WAF) Validation

Periodically re-validate WAF/CDN presence and configuration

Ensure protections cover:

- Bot abuse

- Layer-7 DDoS

- Common web attacks (XSS, SQLi patterns)

5. Public OSINT Footprint Monitoring

Regularly monitor:

- Paste sites

Public repositories

Forums and breach databases

Look for leaked credentials, API keys, or internal references

6. Subdomain Inventory Management

Maintain an up-to-date list of all public subdomains

Identify:

Orphaned subdomains

Third-party hosted services

Deprecated assets

7. Adopt Ongoing Passive Recon as a Process

Schedule **quarterly passive reconnaissance reviews**

Treat OSINT as an **early-warning system**, not a one-time scan

Helps catch changes in infrastructure, DNS, or exposure over time

8. Documentation & Scope Clarity

Clearly document:

What is **in-scope** vs **out-of-scope**

Passive vs active testing boundaries
